----	---

INTRODUCTION

We are pleased to present here the 2014-2015 edition of the Stud Bull Catalogue for the Galician Blond breed (Rubia Galega). This catalogue has been designed as an essential and easy-to-use tool for technicians and breeders when it comes time for them to select the right bull to be used in any given case.

We are also thankful for the collaboration from the various ranches that contribute to this breed's Genealogy Book, who have provided data that was used in order to produce this catalogue.

The large number of progeny that may be obtained from each stud bull, combined with the performance monitoring program carried out by the Association, generates a high volume of data that is essential for determining the genetic value of the bulls.

The genetic values derived from the 2013 performance monitoring data have been used to produce this catalogue. Specifically, these results were produced based upon 293,033 genealogies and 296,147 weights (at birth and at 210 days), and environmental factors were also taken into account. Our objective is to ensure maximum reliability for the genetic indexes through the use of the appropriate animal evaluation model (BLUP). The work was performed using a total of 234,301 animals (82,033 male and 152,268 female).

In relation to a ranch's profitability, it is very important for the appropriate bull to be selected for each cow or heifer, with consideration of both the conformation and the genetics.

The genetic lines of both the sire and dam must be taken into account in order to prevent problems related to inbreeding. The productive and morphological characteristics of the bulls must also be evaluated in order to determine which one is best adapted to each female, in order to ensure the best production.

In this catalogue we therefore display the most relevant information for the bulls, including their genetic value, or in other words, their ability to transmit the characteristics that will provide improvement in their progeny. This edition is presented using three categories:

- Proven bulls
- Bulls with individual evaluation (progeny testing in progress)
- Bulls with individual growth evaluation

The overall objective has been to provide ranchers with bulls that will be useful for achieving their desired performances, and taking improvement of their herds into account.

Acknowledgements

- We would like to thank all of the ranchers who provide daily collaboration by supplying data on their herds for the Genealogy Book.
- We must also acknowledge the various government institutions that have trusted us (ACRUGA) to establish agreements used to pursue genetic improvement of the Galician Blond breed and to manage the breed's Genealogy Book and Improvement Programme.
- We would like to thank the Animal Selection and Reproduction Centre at Xenética Fontao SA, where the Galician Blond breeding bulls and semen bank are maintained and where genotyping and relationship testing is carried out.
- Finally, we wish to thank the University of Zaragoza's Research Results Transfer Office (OTRI in Spanish), where the genetic variability assessments are being carried out for the Galician Blond breed.

GLOSSARY

Identification code: The set of letters and numbers used to identify the animal in the breed's Genealogy Book.

Record: The Record from the Genealogy Book in which the animal is entered.

Final Register (RD in Spanish): Bulls from the Birth Register that are 14 months of age or older and with a morphological rating higher than 70 points.

Merit Register (RM in Spanish): Bulls from the Final Register with a morphology rating higher than 80 points and with at least 10 progeny entered in the Final Register.

Ear Tag: An animal's official individual identification number.

AI Code: A code number issued to each bull at the Animal Selection and Reproduction Centre for use with artificial insemination.

Individual evaluation:

Birth Weight: The bull's weight taken at the breeder's operation, during the first 24 hours of life.

Weaning Weight: The bull's weight taken at the breeder's operation, between 6 and 8 months of age and standardised to 210 days.

Weight at 12 months: The bull's weight at one year of life (at the Testing Centre)

ADG₁₈₀: Average Daily Gain during the individual evaluation. A ratio showing the difference between the weight at the beginning and end of the testing period (8 and 14 months of age, respectively), also considering the duration of this period (180 days).

CI: Conversion Index for feeds during the individual evaluation. Ratio between the concentrated feed consumed and the weight increase during this phase (8 and 14 months of age).

MR: Morphological rating for the bull at 14 months (according to the breed prototype scale).

Progeny testing: assessment of the stud bulls based upon performance monitoring of their progeny at the various affiliated operations (using multiple environmental effects); in other words, based upon the birth weight and weaning weight of the offspring.

Birth Weight: average weight of the bull's male and female progeny. Total average.

Weaning Weight: Weight of the bull's male and female progeny between 6 and 8 months of age (with reference 210 days). Total average.

ADG₂₁₀: Average daily gain for the bull's male and female progeny at 210 days of life for the animal. Total average.

Genetic Index: Inter-herd genetic valuation (different ranches with various environmental effects) for the characteristics with the highest economic impact and related to the objective of improving the Galician Blond breed: birth weight and weaning weight. Determines the genetic merit of the breeding animals as transmittable to the offspring, for each of these characteristics.

% Prec.: percentage of precision or reliability for the prediction. Indicates the degree of invariability of the genetic value as new data is incorporated.

CI (ICO in Spanish): A compound selection index produced from the results of the genetic valuation for the birth weight and weaning weight, giving the same importance to both characteristics but with a positive weighting given to the weaning weight and a negative weighting to the birth weight. This index allows us to provide a genetic rating of the animals for the various characteristics recorded.

Calving Ease: The interest in this characteristic comes from its relationship with problematic births, which can lead to significant expenses for the operation and a high negative impact on the viability of the dam and calf. This is a complex characteristic with a heritability that tends to be low.

Calving ease is rated on a scale of 1-4:

- 1) Solo birth: the cow gives birth alone without any type of assistance from the caretaker.
- 2) Light assistance: the cow requires the presence of a caretaker to assist with the birth due to an inappropriate presentation, position, or posture of the foetus.
- 3) Strong traction: dystocia, complicated, or difficult births that require the presence of more than one caretaker and/or ropes or mechanical elements to extract the foetus.
- 4) Caesarean: surgical intervention is required to extract the foetus.

The improvement seen in recent years in relation to calving ease has been achieved thanks to two lines of action:

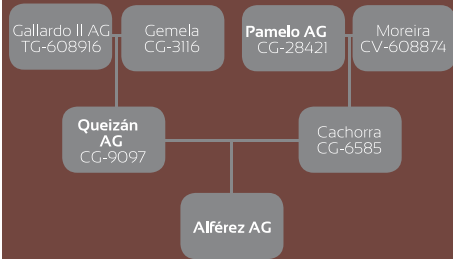

- Study and monitoring of the culard characteristic
- Selection for a low birth weight

- This is a bull that provides large animals with good skeletal development, with good mammary systems in his daughters.
- Indicated for large sized cows and with good calving ease. Not appropriate for heifers.
- Recommended for industrial cross-breeding.

Progeny testing | Evaluation performed using 914 offspring

	Birth		7 months		ADG		% Prec	Birth	7 months
	No.	Weight (kg)	No.	Weight (kg)

- This is a bull with high semen fertility. Good quality.
- The data coming from his daughters demonstrates that they possess an excellent mammary system.
- Recommended for animals with good calving aptitude.

BREED IMPROVEMENT PROGRAMME

(Resolution of 22 November, published in Spain's Official State Gazette (BOE) on 6 December 2011)

OBJECTIVE: to improve production efficiency for the breed

Phases

1) Selection of candidate calves for the testing centre:

- Birth weight: This is determined by the rancher, using a scale or as an estimate, in the first 24 hours after birth.
- Weaning weight: This is determined by the field monitors, using a scale or a zoometric tape, at an age between 6 and 8 months (reference: 210 days).
- Calving ease: this is rated by the rancher on a scale of 1 (solo birth) to 4 (Caesarean required).
- Overall productivity of the breeding female: age at first birth, number of births and calves, interval between births, breeding ability, etc.

2) Individual evaluation at the Testing Centre: (Adai, O Corgo, Lugo):

- Average Daily Gain, post-weaning : difference between the weight at the beginning and end of the testing period (8 and 14 months of age) and considering the duration of this period (6 months).
- Conversion index: weight increase for the animal in relation to the concentrated feed consumed.
- Zoometric measurements: taken at 14 months of age:
 - eight at withers (greater than 128 cm)
 - scapula-ischia length
 - depth of chest
 - width of chest
 - length of hindquarters
 - width of hindquarters
 - thoracic perimeter (large and deep for selected animals, therefore with a higher thoracic capacity).
- Morphological rating at 14 months of age.

3) Progeny testing: monitoring of offspring at the ranching operation and abattoir:

3.1. Monitoring of progeny at the ranch: the offspring from AI and natural service bulls are subjected to performance monitoring at the ranch (phase I)

3.2. Monitoring of progeny at the abattoir: the offspring from AI and natural service bulls are subjected to these yield controls at the abattoir:

- a) Age and weight at slaughter
- b) Weight of the cold carcass (determination of yield on the carcass)
- c) Conformation of the carcass, following the SEUROP system
- d) The fat distribution status of the carcass, on a scale of 1-5

Candidate calves for the testing centre

- a) Offspring of a Mother of Future Stud (MFS in Spanish) and Father of Future Stud (PFS in Spanish)
- b) Pre-weaning ADG₂₁₀ (at 210 days > the breed average)
- c) Morphological rating at weaning of Good or Very Good, based on the animal's muscular and skeletal development
- d) Does not show any appreciable defects in morphology or stance and is within the standard for the breed
- e) Complies with the health regulations in force
- f) Has its relationships confirmed

Classification of breeders:

a) Breeding cow:

- Females from Auxiliary Register (RA in Spanish) or Final Register (RD in Spanish)
- Morphological rating ≥ 65 points

b) Mother of Future Stud (MFS in Spanish):

- Females from RD or Merit Register (RM in Spanish)
- Daughter of an RD or RM father and mother
- CI ≥ 100
- Morphological rating ≥ 70 points (Good)
- ≥ 3 monitored births and ≥ 3 calves with birth weight
- Interval between births < 500 days
- The following reproductive characteristics must also be taken into account: Precocity (age at first birth), interval between births, calving ease, capacity of offspring (average daily gain at 210 days)

c) Natural Service Bull:

- Males from RD
- Morphological rating ≥ 70 points

d) Father of Future Stud (PFS in Spanish):

- Males from RD or RM
- Offspring of an RD or RM father and mother
- CI ≥ 100
- Morphological rating ≥ 80 points (Very Good)
- ≥ 20 progeny with birth weight and weaning weight
- The molecular information provided to us must also be taken into account, showing genes related to productive characteristics or with the quality of the carcass and/or the beef, or related to undesirable characteristics (the culard characteristic) or diseases of genetic origin.

e) Bull for Artificial Insemination:

- Male offspring of MFS and PFS
- RD or RM
- Morphological rating ≥ 80 points
- Positive individual evaluation at the Testing Centre

Galician Blond Beef Foreshank with Chestnuts

Ingredients (4 servings):

- 1.000 g of Galician Blond beef foreshank
- 120 g of onions
- 100 g of leeks.
- 150 g of carrots
- 3 cloves of garlic
- 40 ml of white wine (Ribeiro D.O.)
- 20 ml of extra virgin olive oil
- 2 sprigs of parsley
- Salt
- Whole peppercorns
- Chestnuts, cooked and peeled

Preparation:

Allow the meat to marinate overnight with all of the vegetables and spices. Brown the meat in the olive oil and add the marinade, then allow to cook very slowly for 3 hours.

When the Galician Blond meat is almost ready (tender), add the chestnuts and allow to cook all together for a couple of minutes longer.

Serving:

Serve each portion of meat on a plate surrounded by chestnuts.
